

Submission guidelines

Please have your submission in a compressed folder (*.zip is preferred) with the following structure:

Where the `data` folder contains the `train.csv`, `test.csv`, `sample_solution.csv`, and `solution.csv` (which should echo the same format as the `sample_solution.csv` file). Also, in the main directory, please include your code, reports, and any dashboards or dynamic pages. If you are providing a dashboard application or a document that references the data provided, it should run from this folder.

If we cannot run your code or display your documents from your submission, we may ask you to resubmit your solution. Please try to ensure your code and documents can run from the folder (please check relative paths to the data, include `install.packages()` or `!pip install` statements for libraries that may not be standard to a data science tech stack). This will help keep your application moving through our process quickly and efficiently.

Note: not all assessments need exactly the example files listed in the screenshot. If you are submitting your code and a PDF write up and nothing more, that is fine. I don't expect candidates to refactor their code between python and R, so please do not do that.
